

# Star-planet interactions and dynamical evolution of exoplanetary systems

Cilia Damiani

Post-doc

Laboratoire d'Astrophysique de Marseille

# Star-planet interactions

Close-in planets  
( $a < 0.15$  AU), around  
MS late-type stars

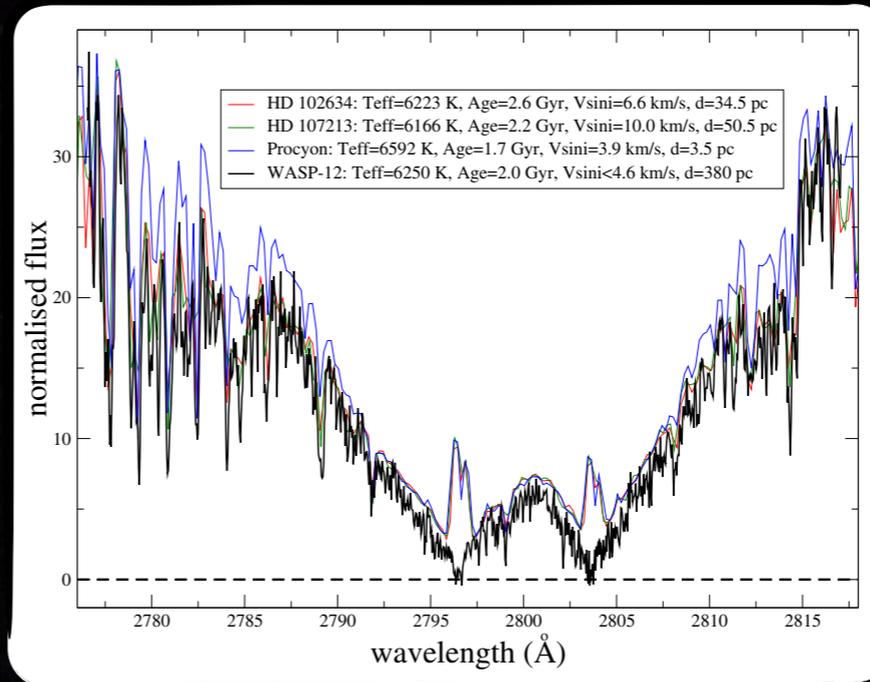

# Star-planet interactions

The WASP-12 systems is shrouded in diffuse gas

Close-in planets ( $a < 0.15$  AU), around MS late-type stars

- Irradiation
  - EUV flux (1-100nm)
    - ➔ evaporation

Haswell et al 2012

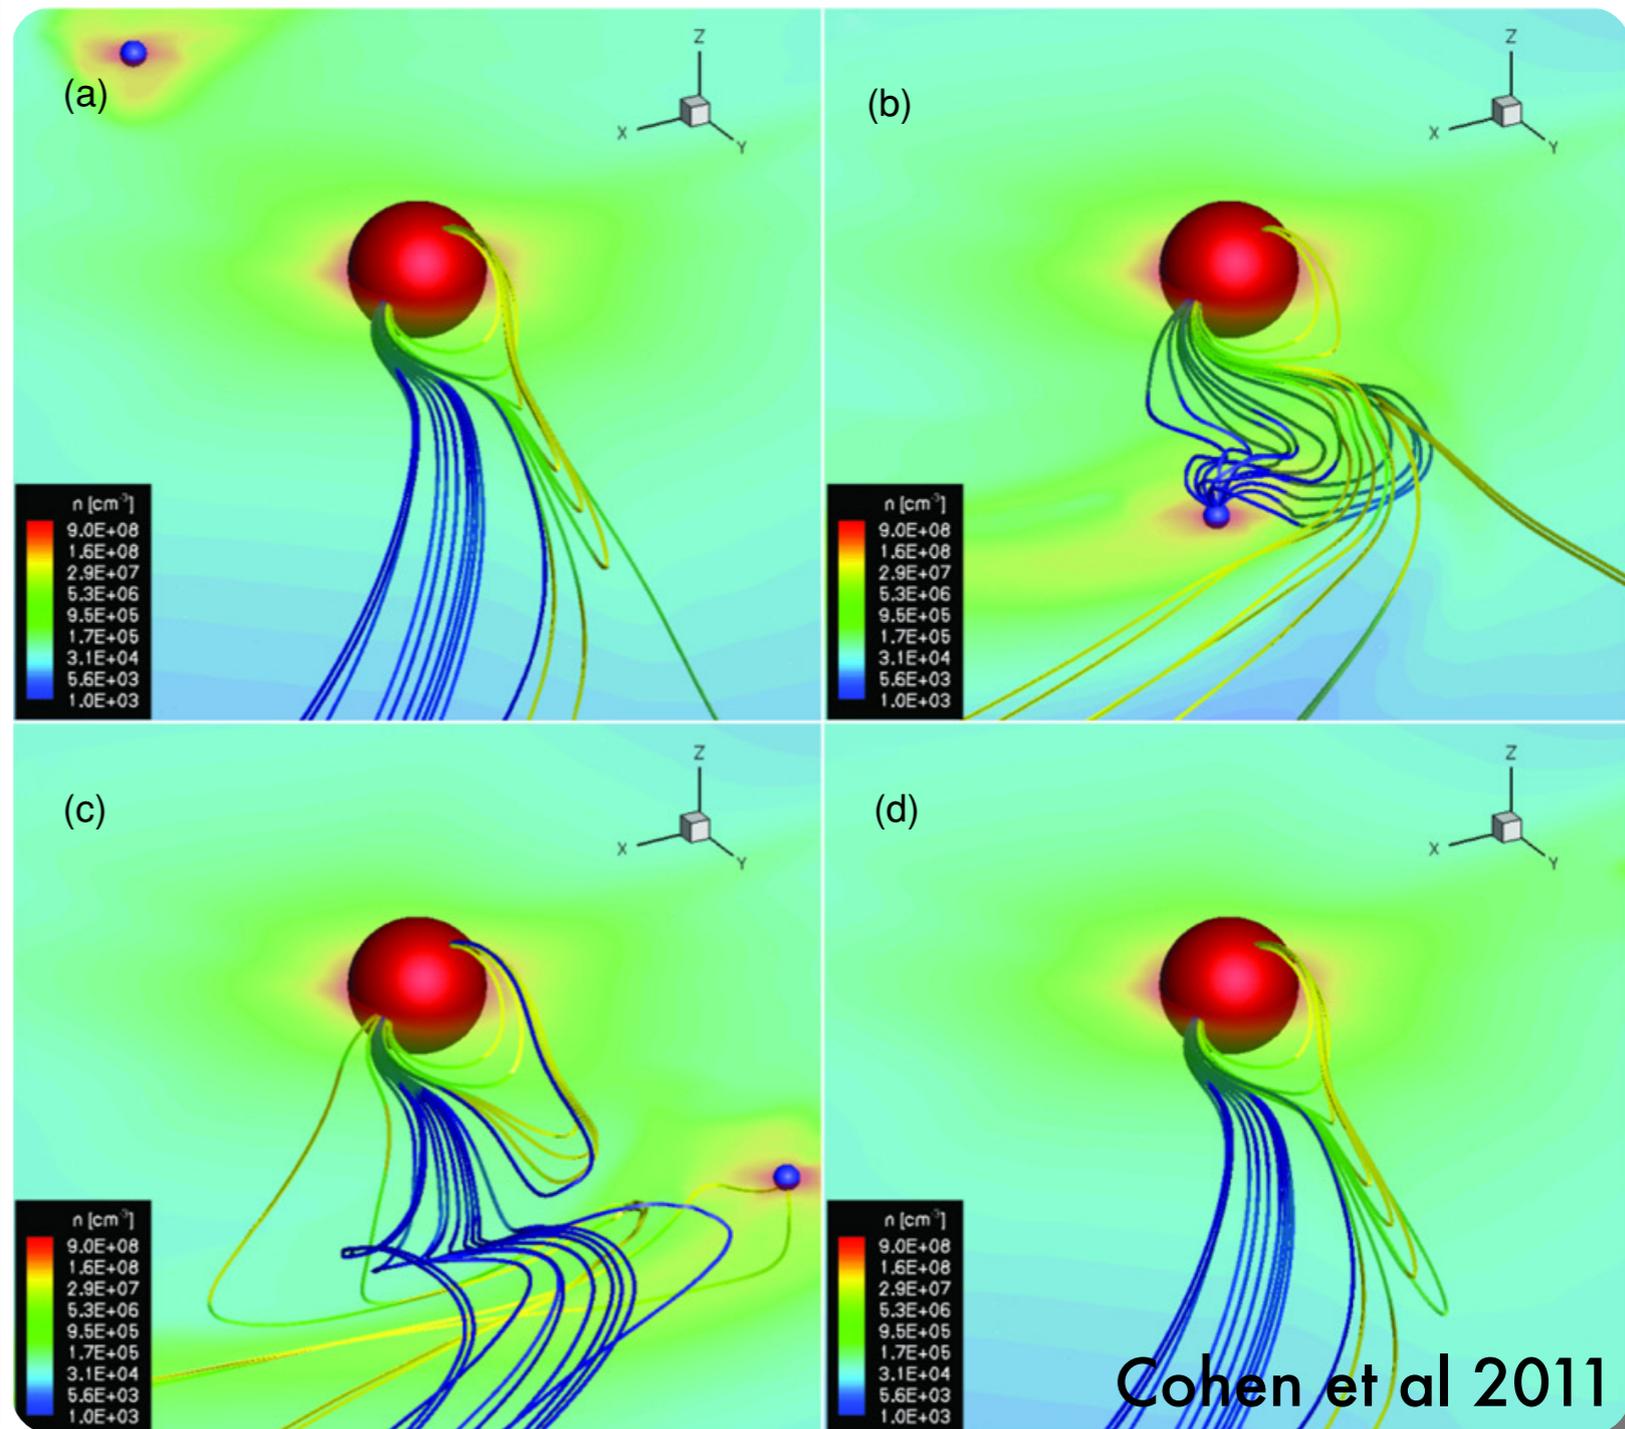

The stellar disc is obscured at all observed phases

# Star-planet interactions

Close-in planets  
( $a < 0.15$  AU), around  
MS late-type stars

- Irradiation
  - EUV flux (1-100nm)  
→ evaporation
- Magnetic field(s)
  - Sub-alfvénic regim,  
magnetic reconnections  
possible

Time-dependent MHD  
simulations of HD 189733

# Star-planet interactions

Close-in planets  
( $a < 0.15$  AU), around  
MS late-type stars

- Irradiation
  - EUV flux (1-100nm)  
→ evaporation
- Magnetic field(s)
  - Sub-alfvénic regim,  
magnetic reconnections  
possible
- Gravitation
  - Tidal torque  $\propto a^{-6}$

• Close-in giant planets cannot form  
*in situ*

• How did they migrate?

- planet-disc interactions
- planet-planet interactions
- planet-planetesimal disc interactions
- planet-distant star companion (Kozai-Lidov)

• The end of migration is the  
beginning of tidal interactions

# Tidal evolution outcome

Barker & Ogilvie 2009

## Tidal circularization time (for co-planar orbit)

$$\tau_e \approx 16.8 \text{Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right)^{\frac{8}{3}} \left( \frac{M_J}{m_p} \right) \left( \frac{R_\odot}{R_\star} \right)^5 \left( \frac{P_{\text{orb}}}{1\text{d}} \right)^{\frac{13}{3}} \\ \times \left[ \left( f_1(e) - \frac{11}{18} \frac{P_{\text{orb}}}{P_\star} f_2(e) \right) + \frac{Q'_p}{Q'_\star} \left( \frac{m_\star}{m_p} \right)^2 \left( \frac{R_p}{R_\star} \right)^5 \left( f_1(e) - \frac{11}{18} f_2(e) \right) \right]^{-1}$$

## Tidal alignment time (for circular orbit and small inclination)

$$\tau_i \approx 70 \text{Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right) \left( \frac{M_J}{m_p} \right)^2 \left( \frac{R_\odot}{R_\star} \right)^3 \left( \frac{P_{\text{orb}}}{1\text{d}} \right)^4 \frac{12.5\text{d}}{P_\star} \left[ 1 - \frac{P_{\text{orb}}}{2P_\star} \left( 1 - \frac{I\Omega}{h\mu} \right) \right]^{-1}$$

## Tidal inspiral time (neglecting tides in the planet and for circular and co-planar orbit)

$$\tau_a \approx 12.0 \text{Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right) \left( \frac{M_J}{m_p} \right) \left( \frac{P_{\text{orb}}}{1\text{d}} \right)^{\frac{13}{3}} \left( 1 - \frac{P_{\text{orb}}}{P_\star} \right)^{-1}$$

# Tidal evolution outcome

Barker & Ogilvie 2009

## Tidal circularization time (for co-planar orbit)

$$\tau_e \approx 16.8 \text{ Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right)^{\frac{10}{3}} \left( \frac{M_J}{m_p} \right) \left( \frac{R_\odot}{R_\star} \right)^5 \left( \frac{P_{\text{orb}}}{1 \text{ d}} \right)^{\frac{13}{3}} \\ \times \left[ \left( f_1(e) - \frac{11}{18} \frac{P_{\text{orb}}}{P_\star} f_2(e) \right) + \frac{Q'_p}{Q'_\star} \left( \frac{m_\star}{m_p} \right)^2 \left( \frac{R_p}{R_\star} \right)^5 \left( f_1(e) - \frac{11}{18} f_2(e) \right) \right]^{-1}$$

$$\tau_e \approx 4 \text{ Myr, for } e = 0.4 \text{ and } P_{\text{orb}} = 3 \text{ d}$$

## Tidal alignment time (for circular orbit and small inclination)

$$\tau_i \approx 70 \text{ Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right) \left( \frac{M_J}{m_p} \right)^2 \left( \frac{R_\odot}{R_\star} \right)^3 \left( \frac{P_{\text{orb}}}{1 \text{ d}} \right)^4 \frac{12.5 \text{ d}}{P_\star} \left[ 1 - \frac{P_{\text{orb}}}{2P_\star} \left( 1 - \frac{I\Omega}{h\mu} \right) \right]^{-1}$$

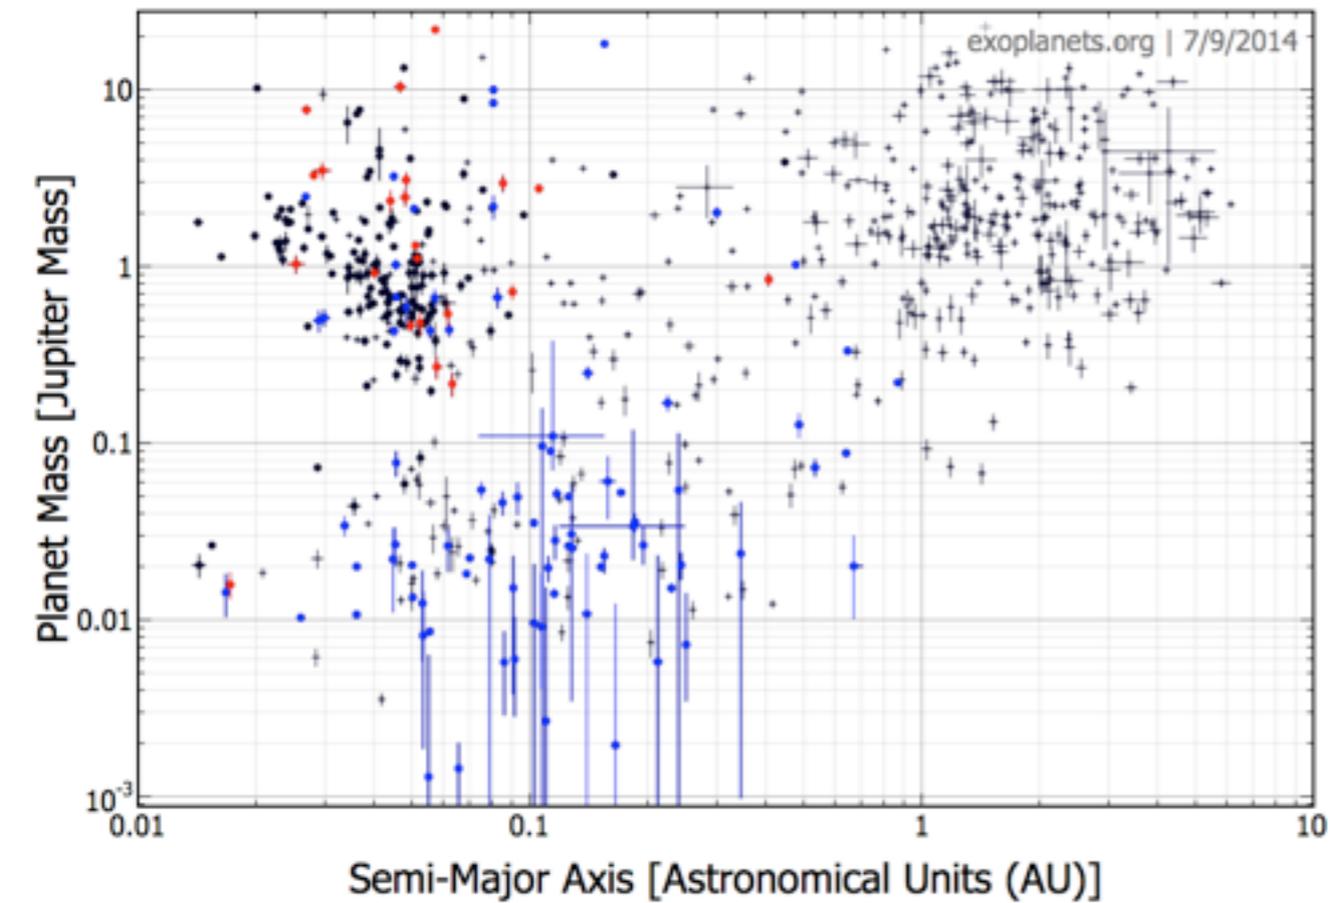

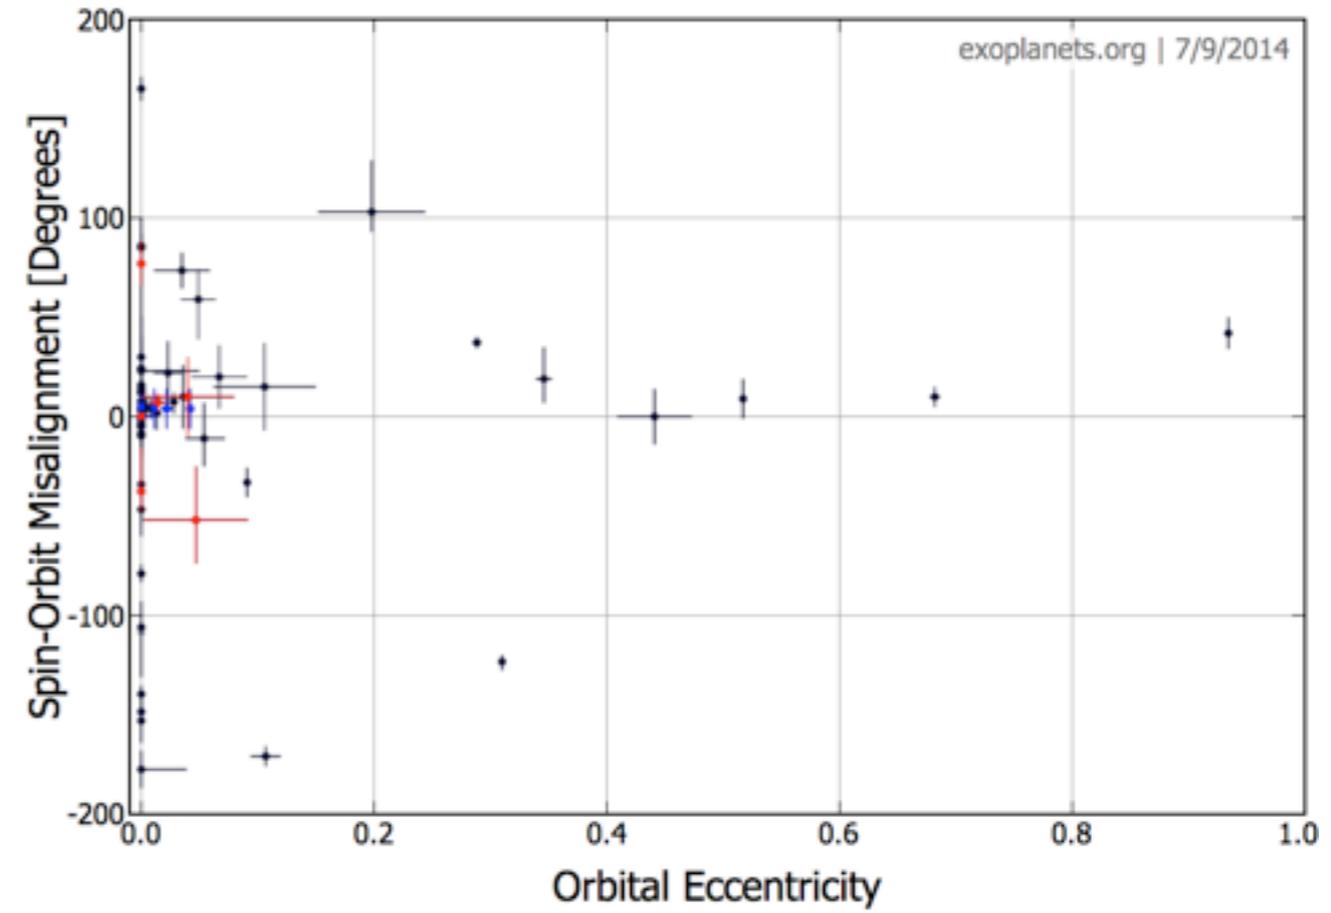

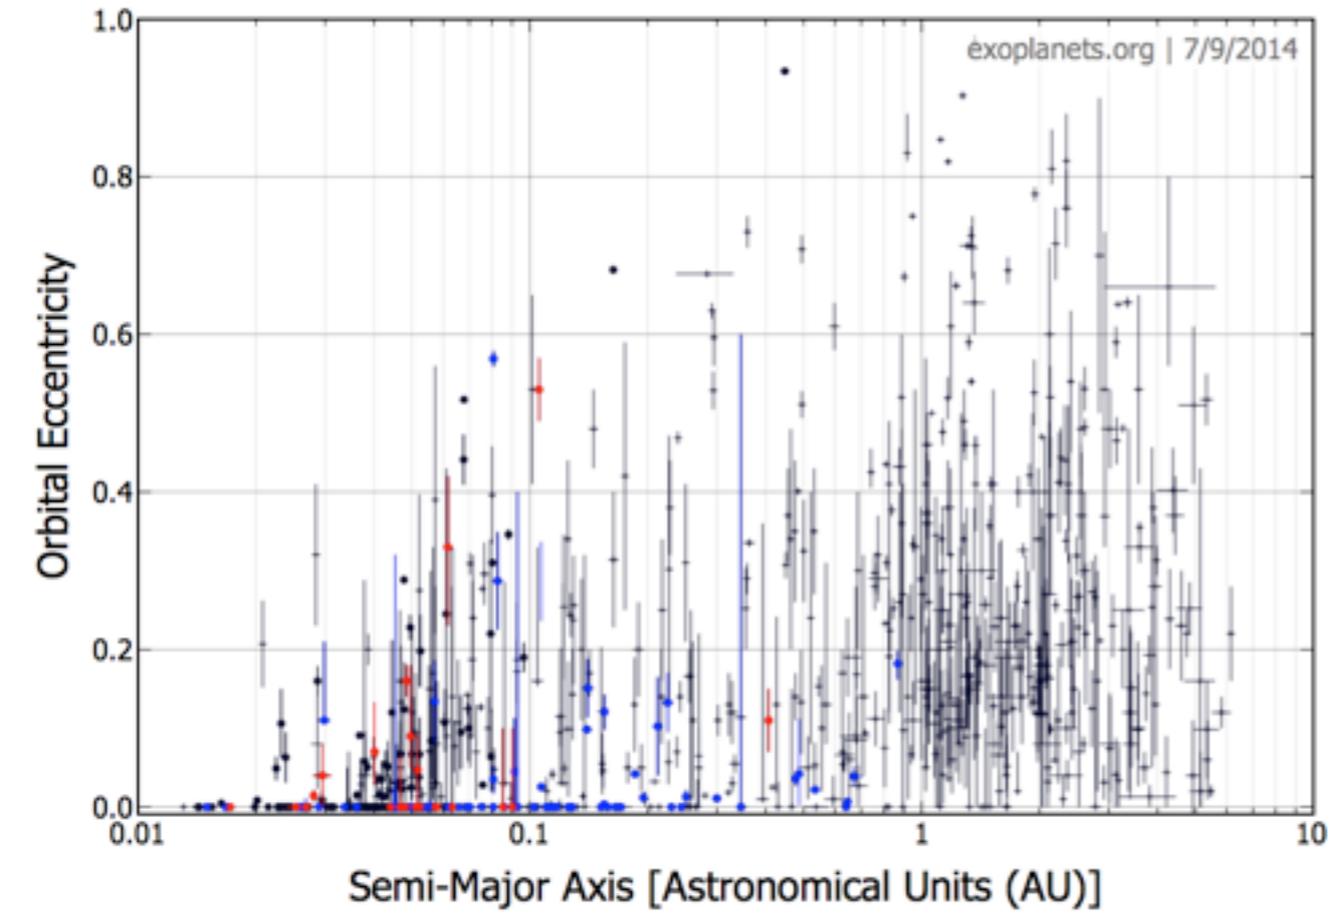

$$\tau_i \approx 6 \text{ Gyr, for } P_{\text{orb}} = 3 \text{ d and } P_\star = 12.5 \text{ d}$$

## Tidal inspiral time (neglecting tides in the planet and for circular and co-planar orbit)

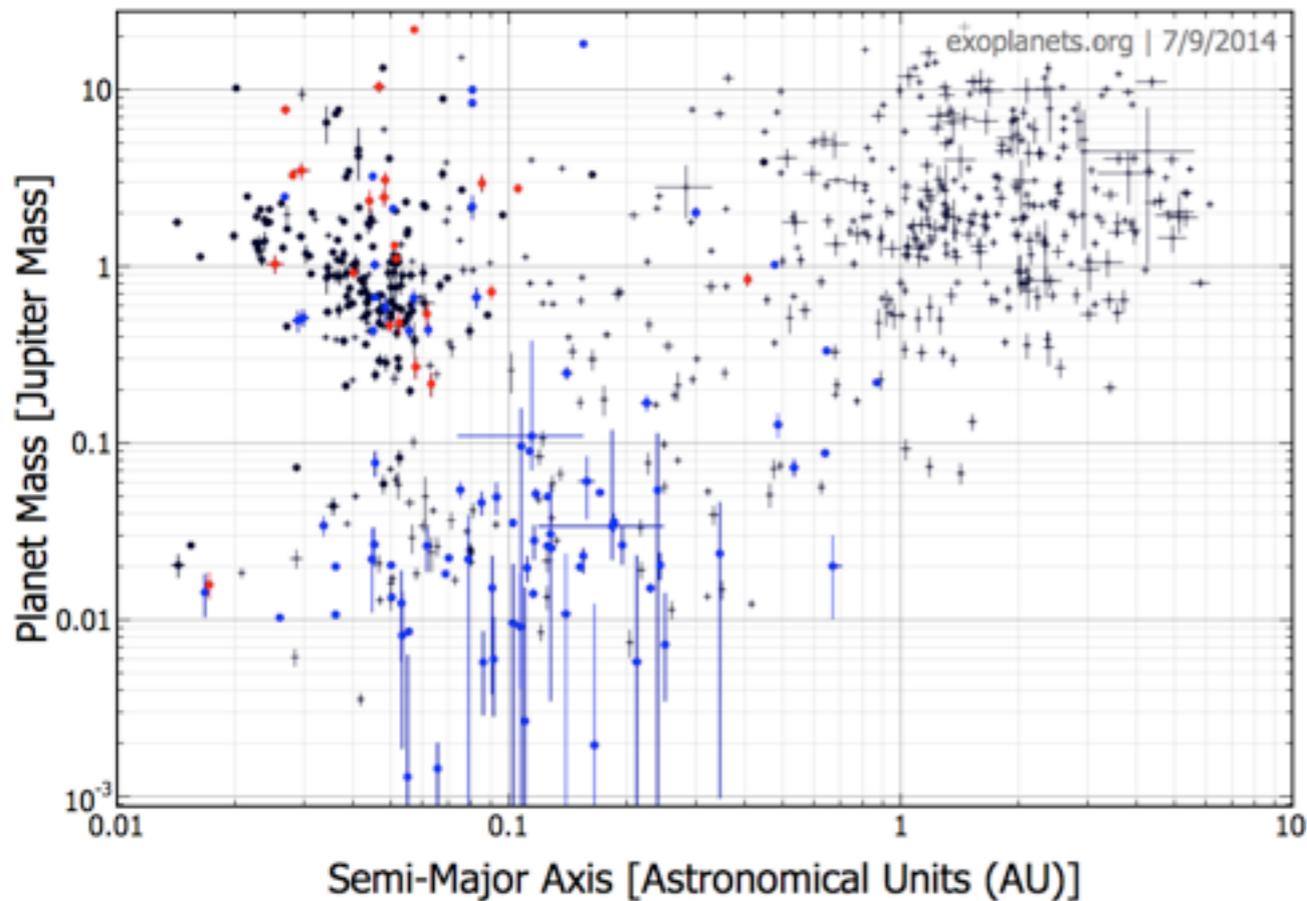

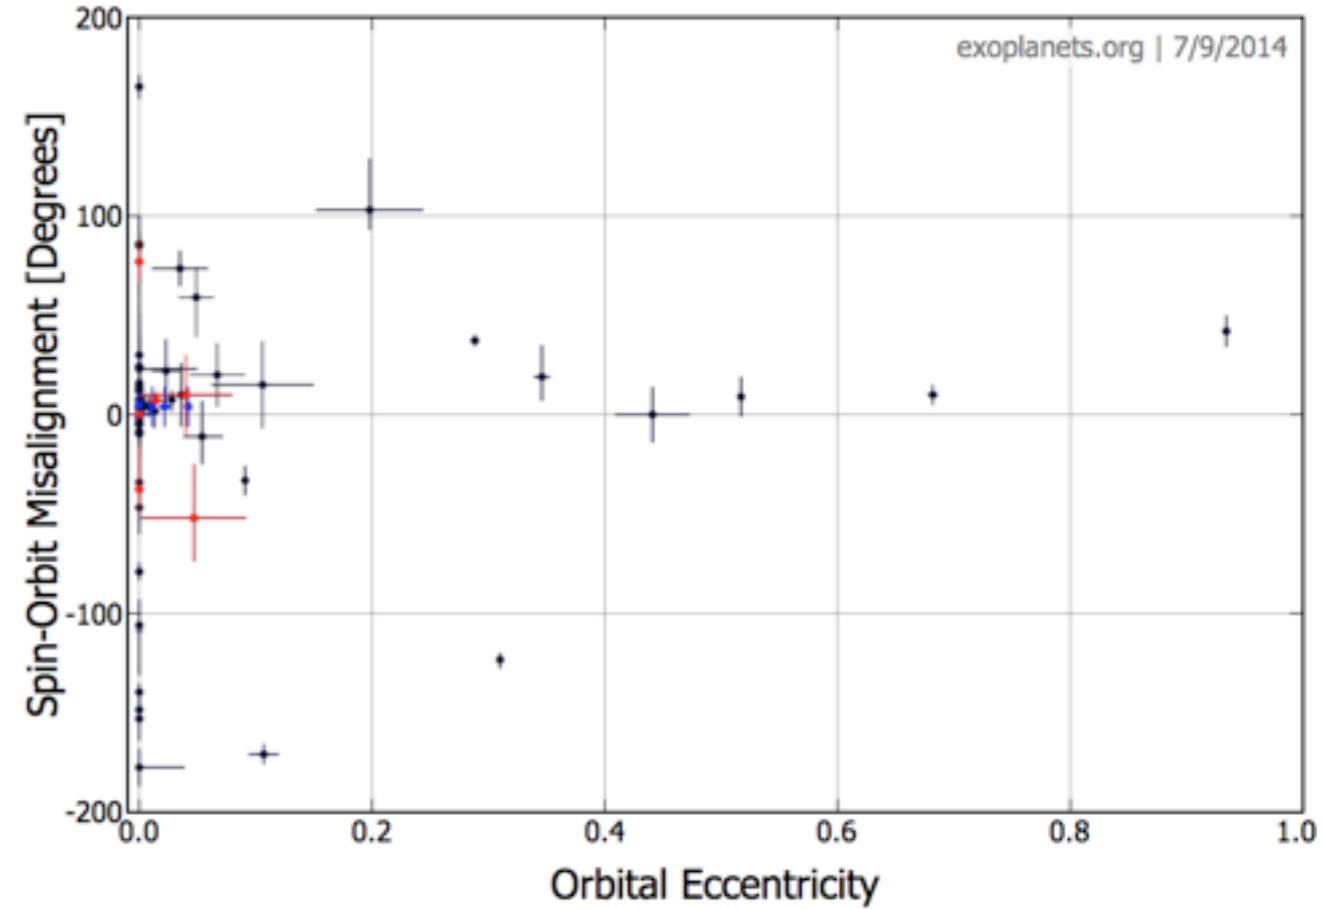

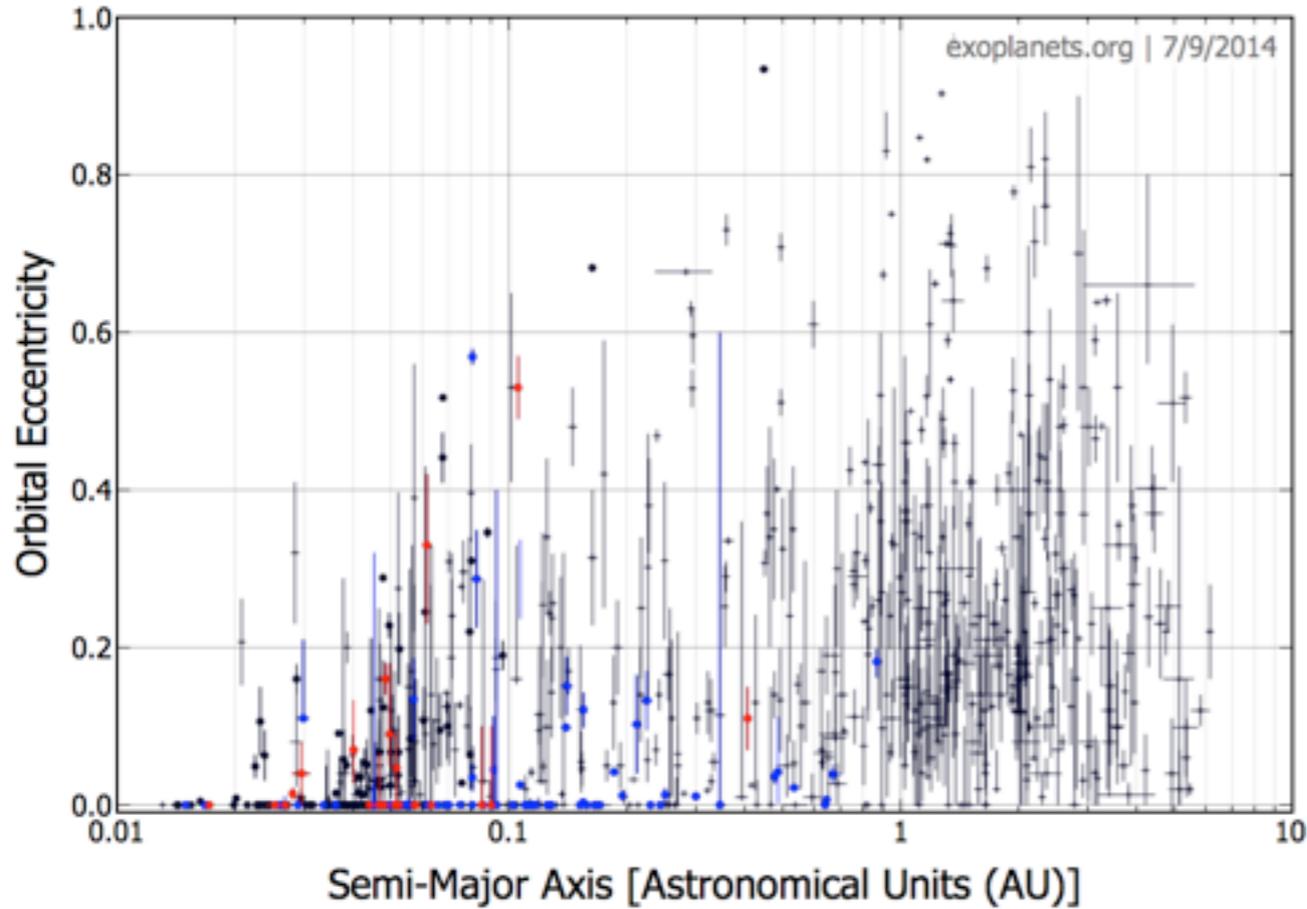

$$\tau_a \approx 12.0 \text{ Myr} \left( \frac{Q'_\star}{10^6} \right) \left( \frac{m_\star}{M_\odot} \right) \left( \frac{M_J}{m_p} \right) \left( \frac{P_{\text{orb}}}{1 \text{ d}} \right)^{\frac{13}{3}} \left( 1 - \frac{P_{\text{orb}}}{P_\star} \right)^{-1}$$

$$\tau_a \approx 2 \text{ Gyr, for } P_{\text{orb}} = 3 \text{ d and } P_\star = 12.5 \text{ d}$$

# Observations

# Observations

- How efficient is tidal dissipation?

- observational constraints:

Jackson et al 2008, Matsumura et al 2008, Deleuil et al 2012, Carone & Patzold 2007, Lanza et al 2011...

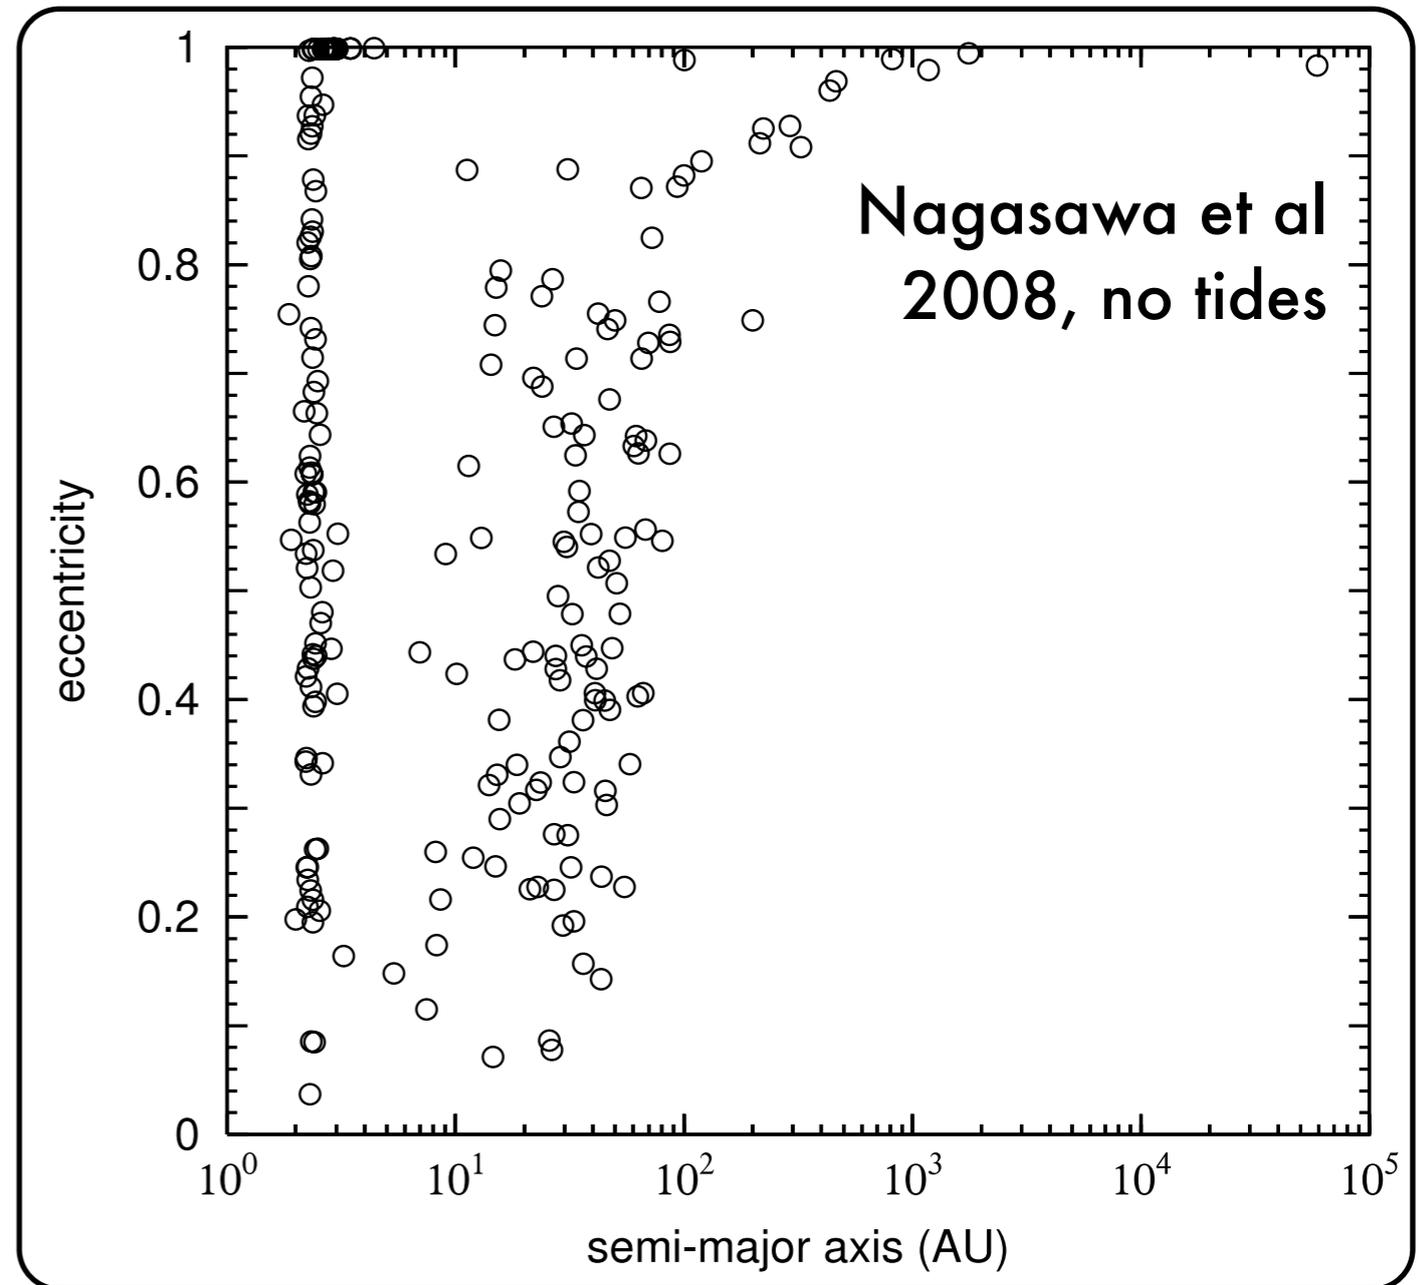

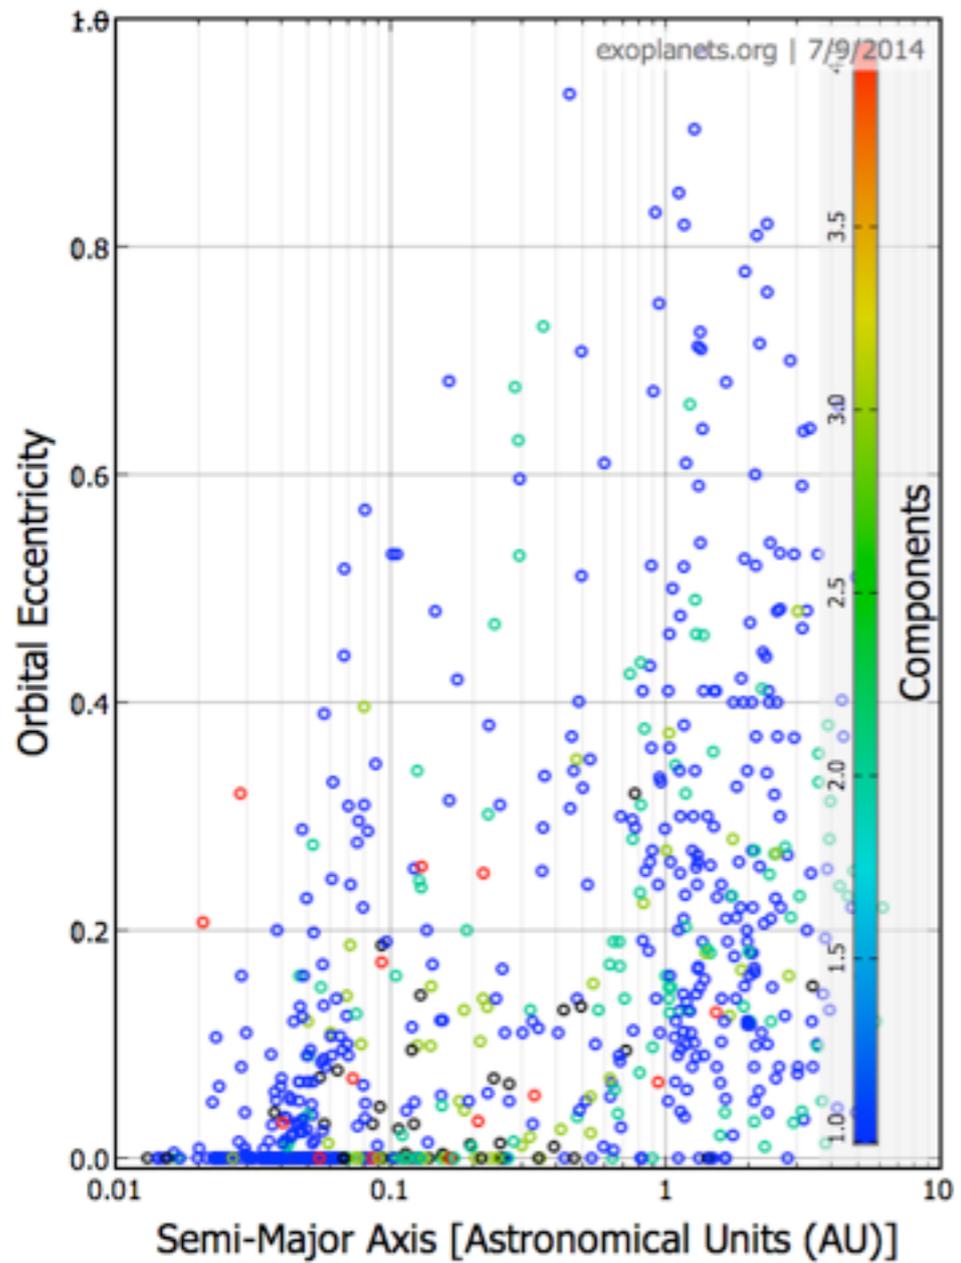

➔ See next talk

# Excentricity

Origin?

*Planet-planet scattering*

(Rasio & Ford 1996, Weidenschilling & Marzari 1996)

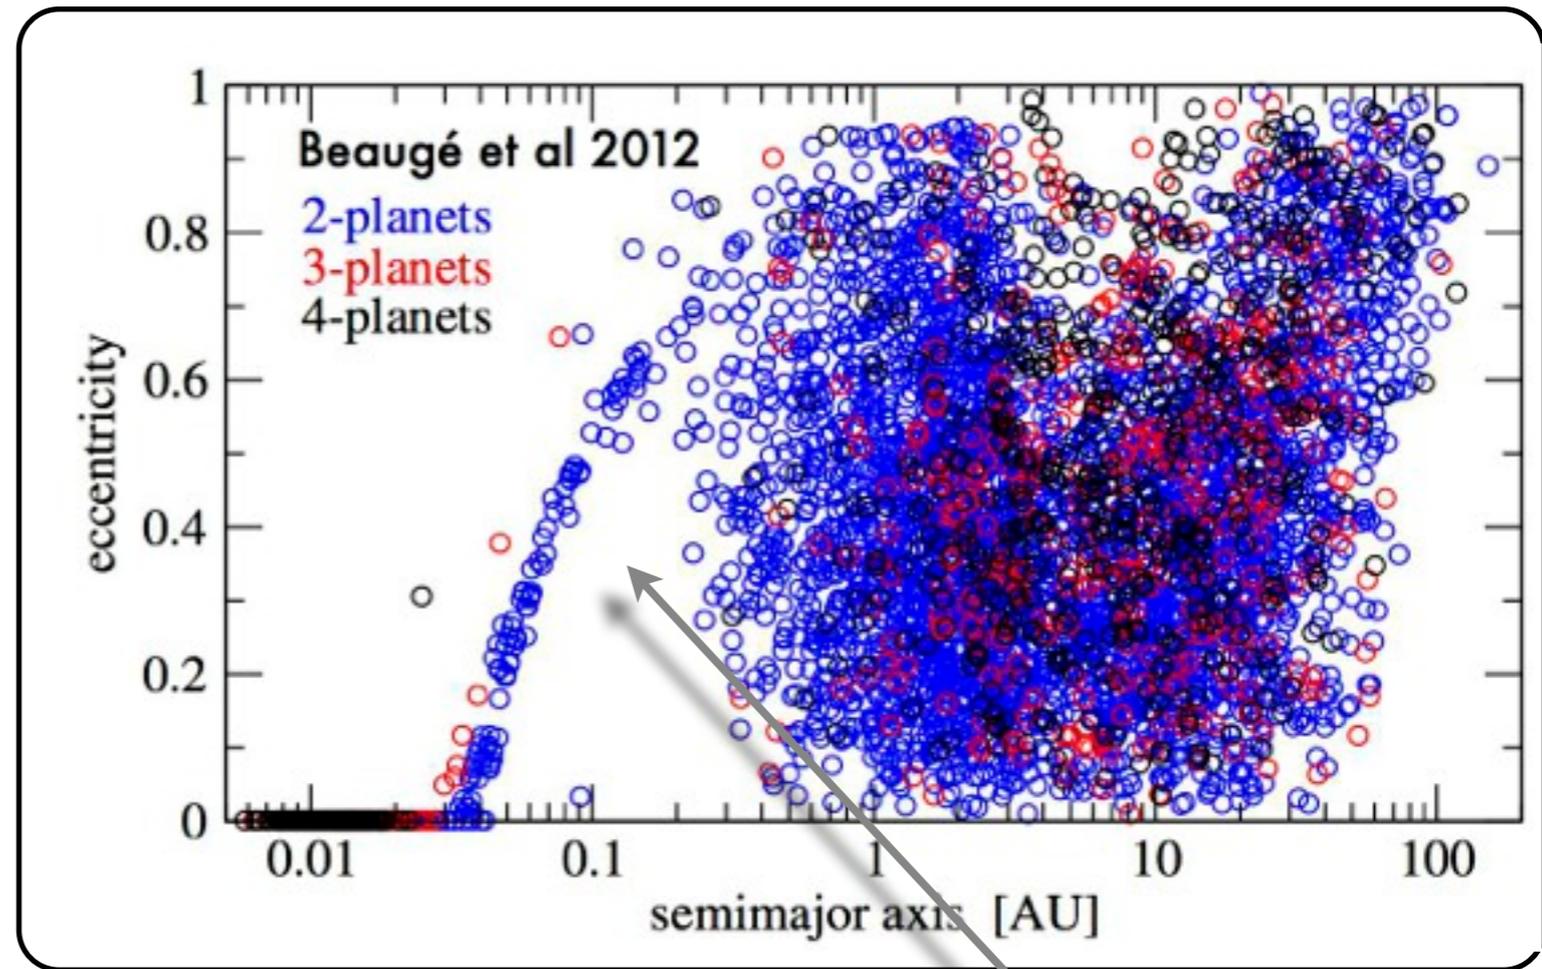

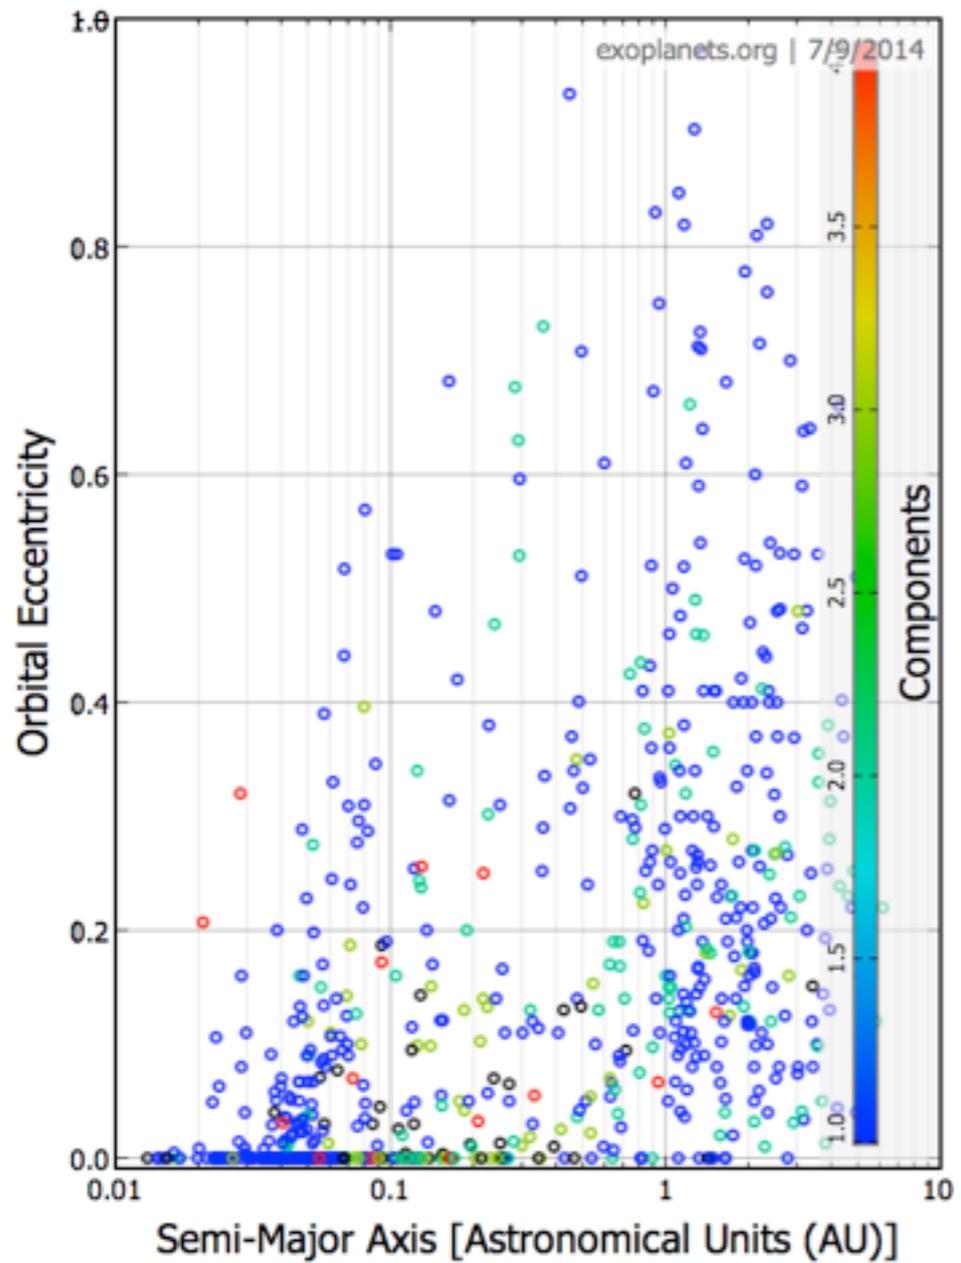

# Excentricity

Origin?

Planet-planet scattering &  
tidal circularization

(Nagasawa et al 2008)

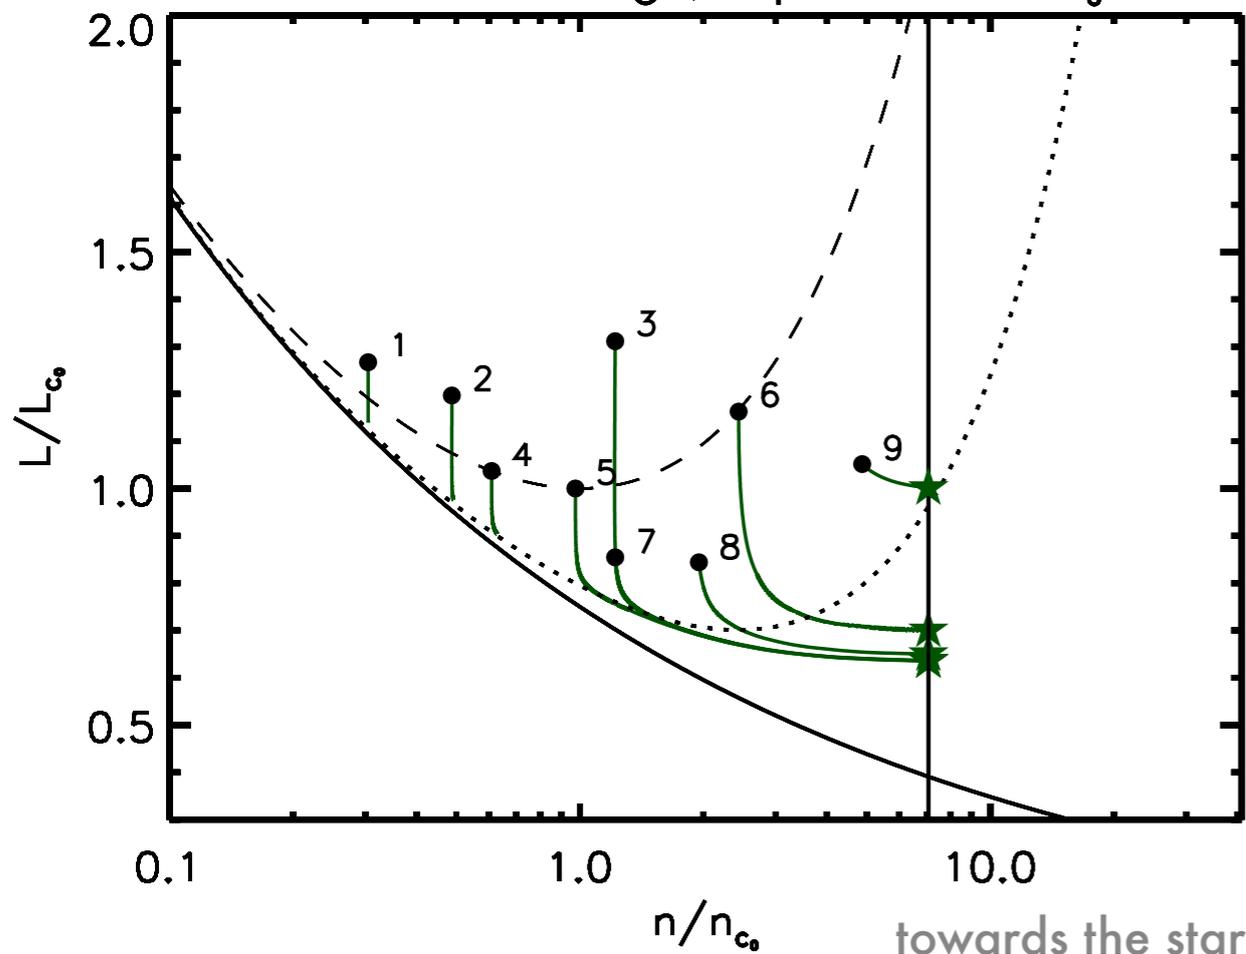

$$Q'_p \sim 10^6 - 10^7$$

Spread?

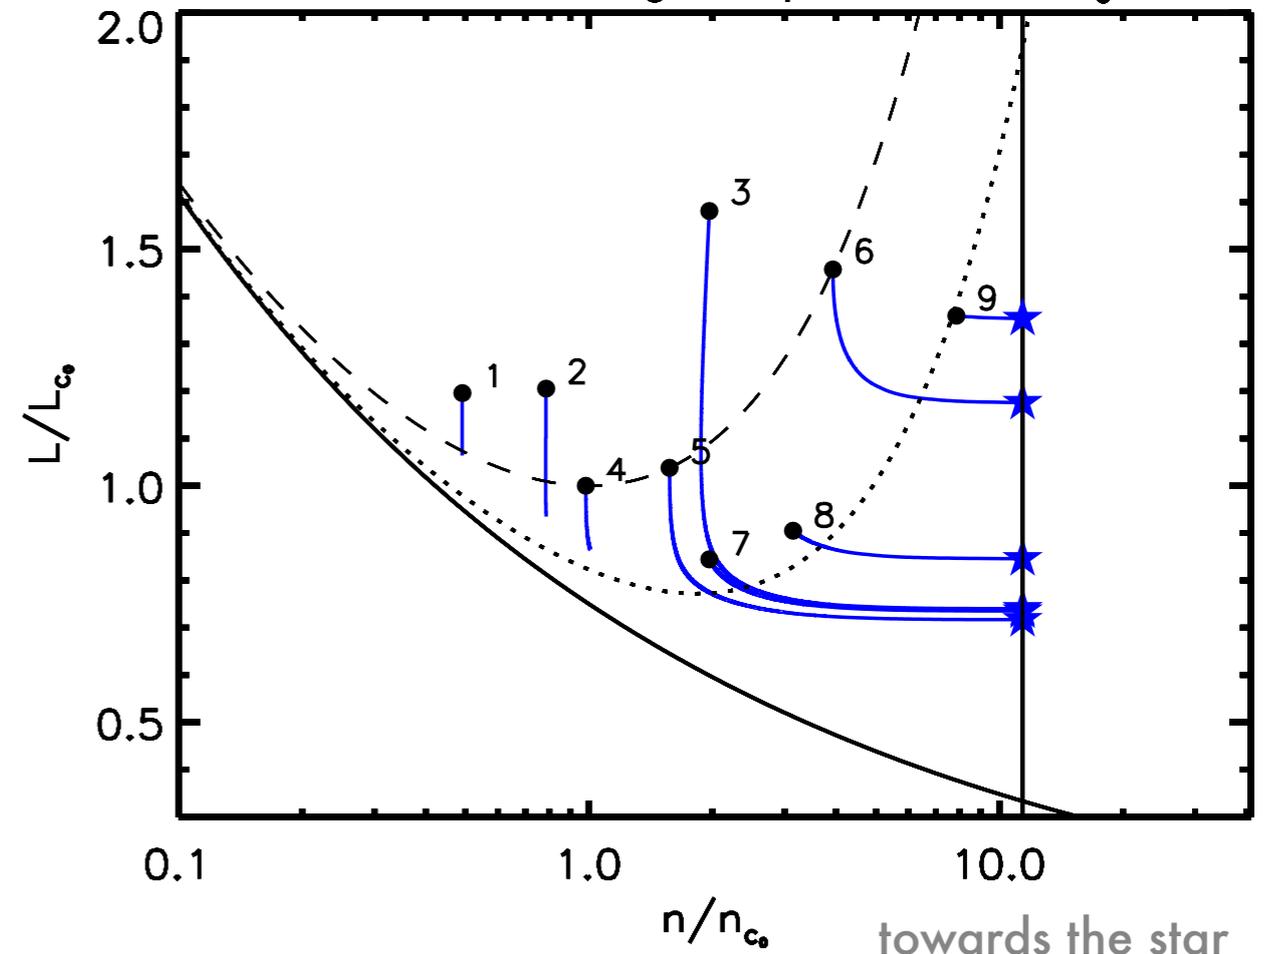

# Role of angular momentum loss

- G-type stars loose angular momentum from their magnetized wind, F-type stars too but less so
- The dynamical evolution of orbital elements is driven by the resultant of the wind torque and the tidal torque

$M_s = 1.0 M_\odot$ ,  $M_p = 1.0 M_J$

$M_s = 1.4 M_\odot$ ,  $M_p = 1.0 M_J$

# Role of angular momentum loss

- G-type stars loose angular momentum from their magnetized wind, F-type stars too but less so
- The dynamical evolution of orbital elements is driven by the resultant of the wind torque and the tidal torque
- The wind efficiency dependance on stellar parameters is not well known but
  - ➡ Could explain the spread in excentricity (Dobbs-Dixon et al 2004)
  - ➡ Could explain the spin/orbit misalignement (Dawson 2014)
  - ➡ Could explain the delay of the tidal decay (Damiani et al 2014)

# Conclusion

- Understanding star-planet interaction is a necessary step to confront observations and predictions of formation/migration models
- For hot-Jupiters around late-type stars the magnetized wind torque can be comparable (and opposite) to the tidal torque
- By providing accurate masses, radii and orbital parameters, CoRoT and Kepler have helped put constraints on tidal dissipation efficiency and magnetic braking
- Better ages and stellar physics are essential to understand exoplanetary systems dynamics (we need PLATO)

Thank you!
